The present sequence encodes a human apoptosis associated protein designated HAPOP-1. HAPOP proteins are apoptosis regulators which have antiarteriosclerotic, cytostatic, antiarthritic and hepatotropic activity. A pharmaceutical composition mapped to activity. A pharmaceutical composition comprising HAPOP in conjunction with a carrier, a purified antagonist of HAPOP, vectors and agonists of HAPOP, are administered for diagnosing, treating or preventing disorders associated with increased or decreased apoptosis, e.g. call proliferative disorders such as rhematolal arthritis, systemic lupus erythematosus; reproductive disorders such as prostate cancer, endometrial and ovarian tumours; and gastrointestinal disorders such as cirrhosis, colitis, hepatitis and pancreatitis. The polymuclocitides encoding HAPOP proteins may be useful to detect and quantitate expression of HAPOP genes which are correlated with diseases and are also useful to detect differences in the chromosomal location due to translocation, invession of the correlated with diseases and etc. the combination of the correlatic agents may act synergistically to effect the treatment or prevention of various disorders providing improved efficacy with lower dosages of each agent and thus reducing the potential for adverse side effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ij

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                       The present sequence encodes human FIN-1 (FLICE inhibitor-1), which is a caspase. FLICE (ICE-IAP7) is a protease of the interleukin-converting enzyme family, a protein involved in the regulation of cell death. A host cell, comprising a vector containing FIN-1 encoding DNA, can be used to produce FIN-1. The vector containing the DNA can be used for producing a cell which expresses a polypeptide by transforming or transfecting the cell with it so that the cell expresses the polypeptide or transfecting the cell with it so that the cell expresses the polypeptide or transfecting the cell with it so that the cell expresses the polypeptide or to antagonist can be used in the vector. The polypeptide or its invivo administration. Conditions which may be treated include viral infection, tumours (especially solid tumours), ischaemic injury (e.g. stroke or myocardial infarction), neurodegenerative disorders (e.g. Alzheimer's or Parkinson's disease, osteoarthritis, polycystic kidney disease, chronic degenerative liver disease, acquired immunodeficiency syndrome (AIDS) and aplastic anaemia the

The present invention describes a new treatment of a condition characterised by vascular wall inflammation in a subject comprising administering a FLIP molecule to inhibit Fas ligand-mediated apoptosis of vascular endothelial cells in the subject. The method can be used to treat atherosclerosis, transplant arteriosclerosis and

us-09-380-546a-1.rng

negative regulator of caspase 8, File-C, where (1) specifically hardiases with and inhibits expression of the protein, or specifically hyridiases with at least an 8-nucleobase portion of an active site on (11). (1) has antinflammatory and anti-tumour activities. (1) is an inhibitor of File-c expression, a modulator of apoptosis and can be used in attisense gene therapy. (1) is useful for inhibiting the expression of File-c in cells or tissues, and for treating an animal having a disease or condition associated with File-c. (1) is also useful for modulating apoptosis in a cell, where a caspase such as caspase 8, caspase 3 or caspase 7 is activated, and the File-c. (1) is also useful for diagnostics, therapputics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of a biological pathway, and in antisense gene therapy. (1) is also useful complylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence encodes human File-c as given in an example from the present invention. targeted to a nucleic acid molecule (II) encoding a natural dominant \$

compain (FADD) like ICE (I-FLICE) protein, designated I-FLICE-1. The domain (FADD) like ICE (I-FLICE) protein, designated I-FLICE-1. The proteins can inhibit both TYRR-1 and CD-95 induced apoptosis. These are the first examples of a naturally occurring catalytically inactive caspase that can act as a dominant negative inhibitor of apoptosis. The polypeptides and agonists can be used for treating e.g. Alzheimer's disease, Parkinson's alsease, rheumatoid arthritis, septic shock, sepsis, stroke, CNS inflammation, osteoporosis, ischaemia, reperfusion injury, cell death associated with cardiovascular disease, polycystic kidney disease, apoptosis of endothelial cells in cardiovascular disease, cell death associated with polypeptides can be used for treating cancers (e.g. follicular lymphomas, carcinomas with p53 mutations.) cell for follicular lymphomas, carcinomas with p53 mutations. Inver, lung, pancreas, and cancers of the breast, ovary, prostate, bone, liver, lung, pancreas, and spiden), autoimmune disorders ceg. systemic lupus erythematosus, immune-related glomerulonephritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   rheumatoid arthritis), and viral infections (e.g. herpes viruses, pox viruses and adenoviruses), graft versus host disease, acute disease, acute graft rejection, and chronic graft rejection. The products can also be used for detection, diagnosis and drug screening.
                                                                                                                                                                                                                                    disease;

This sequence encodes the human CLARP protein. The invention relates to the human RICK (RIP-like interacting CLARP kinase) protein. The RICK the human RICK (RIP-like interacting CLARP kinase) protein acts as a positive requiator of apoptosis, potentiating apoptosis induced by caspase-8 and capase-10 during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors of row provides methods and compositions of the various compositions and activators, and methods and compositions of the various compositions of the interactions of the various compositions of the interactions of the various compositions of the interactions of the various compositions of and DREP-1). RICK is useful in screening assays for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of apoptosis. Complexes containing RICK and CIARP can be used in drug screening assays to identify inhibitors of the enzymatic of noting by the complexes containing RICK and containing to growth and dysregulation of ARC-like inhibitors of the enzymatic activity of caspase-8. Identification of ARC-like inhibitors compositions of containing useful for gene therapy treatment of disease with increased cell disease. Antirick antibodies can be used discreters, aphastic anaemia, ischaemic injury, and toxin-induced liver of alsomates. A specific inhibitor of an essential step in the biochemistry of apoptosis is needed. RICK interaction with intracellular factors such as apoptosis is neceded. RICK interaction with intracellular factors of RICK binding to intracellular apoptosis factors are potential drug candidates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

The present sequence represents DNA coding for MACH-related inducer of toxicity (MRIT) isoform MRIT alpha 1 (see AAY05787), a CED-4 chamily polypeptides, and which has pro-apoptotic activity. An EST sequence having homology to the p20 domain of human ICE-like protease MACHL/FLICE was isolated from an EST database. Several coverlapping EST clones were sequenced to deduce the sequence of the full-length MRIT alpha 1 clone and 2 isoforms, alpha 2 (see AAX5509) and beta 1 (see AAX5510). The MRIT alpha 1 includes an N-terminal death effector domain and a C-terminal caspase homology domain, but is not a cysteine protease. Selective enhancers and inhibitors of MRIT apoptotic activity can be identified and used to treat diseases mediated by the dysfunction of programmed cell anthibitors of programmed cell death. A cell accumulation disorder such as cancer, autoimmune disease, viral infection, angiogenesis and atherosclerosis is treated by administering an agent that selectively enhances MRIT apoptotic activity, thereby inducing apoptosis in a subject. A disorder of cell loss, such as a neurodegenerative disorder, including Alzieniems's disease, parkinson's disease, retinitis pigmentosa, stroke, aplastic anaemia, myocardial infarction or AIDS can be treated by administering an agent that selectively inhibits MRIT apoptotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       166

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                       This cDNA clone includes a coding region for a novel human protein (see AAW6915), designated Casper (for caspase-eight-related protein), that is involved in regulation of apoptosis. The clone was involved in regulation of apoptosis. The clone was cloated from a human expressed sequence tag database in a search for potential FADD-related genes. The isolated protein, or cells that express the protein, can be used to screen for agents, cells that express the protein, can be used to screen for agents, cells and thus its function. Nucleic acid sequences encoding Casper to a target, and thus its function. Nucleic acid sequences and primers for diagnostic detection of Casper genes and primers for diagnostic detection of casper genes and to their transcripts, for isolation of related sequences and for the modulate expression of active Casper protein (using antisense or sense sequences). They are also used for recombinant production of Casper and to generate transgenic animals for testing candidate
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ή,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          496

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides recombinant nucleic acid molecules encoding usurplin-alpha (lacking the first death effector domain (DED) or its prodomain), usurplin-beta or usurphin-game. Usurplin polypeptides are useful for in vitro and in vivo identification of usurpin-procaspase-8 interaction inhibitor. Usurpin is useful as modulator of the sensitivity of cells to CD95(Fas/Apo-1) mediated apoptosis. Modulation of apoptosis is useful for treating diseases like autoimmune diabetes, cancer and parkinson's disease. Activators and inhibitors of usurpin-procaspase-8 interaction are also useful for treating various diseases mediated by apoptosis. Usurpin provides an attractive model for modulating caspase activation. Sensitivity of cells bearing CD95(Fas/Apo-1) receptor can be regulated at several levels in the presence of usurpin, conferring
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Usurpin-alpha; death effector domain; DED; prodomain; usurpin-beta; usurpin-qamma; procaspase-8; CD95; apoptosis; cancer; immunosuppressive;

This cDNA sequence codes for human FLAME-1 (see AAW90107), or FADD-11ke apoptotic/anti-apoptotic molecule 1. FLAME-1 is a novel anti-apoptotic protein that interacts specifically with FADD, Nch4, anti-apoptotic protein that interacts specifically with FADD, Nch4, anti-apoptotic protein that interacts specifically with FADD, Nch4, can abrogate Fas/TNR-induced apoptosis upon expression in Fas/TNR-sensitive MCF-7 cells. The FLAME-1 gene was mapped to chromosome 2q3-34. The full-length FLAME-1 cDNA was isolated from a Jurkat cDNA interaction of taself been generated from the Jurkat library using primers (see AAV94139-42) based on an isolated EST clone. Host cells, recombinant vectors, and methods of using FLAME-1 to identify substrates, activators or inhibitors of FLAME-1 are provided. FLAME-1, activators or inhibitors of FLAME-1 are provided FLAME-1, cells, recombinant et frame and methods and agonists can be used to inhibit apoptosis, coff the polypeptides can be used for gene therapy, e.g. antisense cold molecules can be used in vivo for antineoplastic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      69 CGAGTCTCAACTAAAAGGGACTCCCGGAGCTAGGGGTGGGGACTCGGCCTCACACAGTGA

The invention relates to FADD-like apoptotic/anti-apoptotic proteins (FLAME 1 or 2) and nucleic acid molecules encoding such proteins. FLAME sequences are useful for inhibiting apoptosis and for gene therapy of diseases characterised by apoptosis including HIV infection and Alzhelmer's disease. FLAME inhibitors are useful as apoptotic agents and activators are useful as anti-apoptotic agents. FLAME-1 is useful as a bubstrate for caspase in assays to identify caspase inhibitors. The present sequence is human FLAME-1 cDNA.

The transport group is capable of transport group is described. The transport group is capable of transporting the chimeric group or fusion peptide across the cell membrane. The anti-apoptotic polypeptide is FileE-like inhibitor protein (File) which inhibits Fas and TWF mediated apoptosis to thibition peptide are useful for thibiting pathway. The chimeric group and fusion peptide are useful for inhibiting ligand-induced apoptosis by bringing them into contact with T cells. The chimeric group is useful for expanding T cells that the apoptosis of furonically activated to particular antigens such as tumour-specific antigen, for enhancing manner ensponse and to inhibit the apoptosis of furonically activated T cells e.g. activated CD4*+ T cells in HIV infected patients. The chimeric group is also useful for therapeutic, prophylactic or diagnosis of intracellular delivery of small molecules and nucleic acids encoding such polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fusion polypeptide useful for inhibiting ligand-induced apoptosis, comprises portion of anti-apoptotic polypeptide linked to a transport group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

Usurpin polypeptides are useful for in vitro and in vivo identification of usurpin-procaspase-8 interaction inhibitor. Usurpin is useful as modulator of the sensitivity of cells to CD95(Fas/Apo-1) mediated apoptosis. Modulation of apoptosis is useful for treating diseases like autoimmune diabetes, cancer and Parkinson's disease. Activators and inhibitors of usurpin-procaspase-8 interaction are also useful for treating various diseases mediated by apoptosis. Usurpin provides an attractive model for modulating caspase activation. Sensitivity of cells bearing CD95(Fas/Apo-1) receptor can be regulated at several levels in the presence of usurpin, conferring resistance to Fas-ligand cell death. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                    immunosuppressive;

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
